In the past decade, new developments in high-pressure experiments,

particularly with synchrotron X-ray techniques, have advanced the study of magmas under pressure. These new experiments have revealed significant changes of structure and physical properties of magmas under pressure, which significantly improves our understanding of the behavior of magmas in the earth's interior. This book is an important reference, not only in the earth and planetary sciences, but also in other scientific fields, such as physics, chemistry, material sciences, engineering and in industrial applications, such as glass formation and metallurgical processing. Includes research and examples of high-pressure technologies for studying

the structure and properties of magma
Summarizes the current knowledge on the structure and properties of high-pressure magma
Highlights the importance of magma in understanding the evolution of the earth's interior

Climate Change 2014 - Impacts, Adaptation and Vulnerability: Part A: Global and Sectoral Aspects: Volume 1, Global and Sectoral Aspects Springer Nature

Interrogates the rise of national philosophies and their impact on cosmopolitanism and nationalism.

The Cognitive Neurosciences, sixth edition Springer Science & Business Media

By drawing on quantitative data and qualitative analyses of five major national education policies implemented in India over the last 15 years, this comprehensive volume explores their impact on teacher quality and perceived effectiveness, explaining how this relates to variations in student performance. Responding to a national agenda to increase the quality of the Indian teacher workforce, Teacher Quality and

Education Policy in India critically questions the application of human capital theory to Indian education policy.

Chapters provide in-depth and strategically structured analyses of five national policies – including the recently approved National Education Policy (NEP) 2020 – to see how Indian policymakers use teacher quality as a driver and measurement of education and national economic development. Ultimately, the text offers evidence-based policy recommendations to improve teacher quality in India, suggesting that while all five policies have contributed significant frameworks and recommendations for teacher quality reform, they have failed to move beyond a symbolic function. Given its rigorous methodological approach, this book will be a valuable addition to the under-researched question of education policymaking in postcolonial contexts. It will be an indispensable resource not only for scholars working on policymaking in the Indian context, but also for those working at the intersection of education, teacher development, and

policymaking in developing countries.

The sixth edition of the foundational reference on cognitive neuroscience, with entirely new material that covers the latest research, experimental approaches, and measurement methodologies. Each edition of this classic reference has proved to be a benchmark in the developing field of cognitive neuroscience. The sixth edition of *The Cognitive Neurosciences* continues to chart new directions in the study of the biological underpinnings of complex cognition—the relationship between the structural and physiological mechanisms

of the nervous system and the psychological reality of the mind. It offers entirely new material, reflecting recent advances in the field, covering the latest research, experimental approaches, and measurement methodologies. This sixth edition treats such foundational topics as memory, attention, and language, as well as other areas, including computational models of cognition, reward and decision making, social neuroscience, scientific ethics, and methods advances. Over the last twenty-five years, the cognitive neurosciences have seen the development of sophisticated tools and methods, including computational approaches that generate enormous data sets. Atomic and Nanometer-Scale Modification of Materials Springer

This volume contains the proceedings of the

conference on "Atomic and Nanometer Scale Modification of Materials: Fundamentals and Applications" which was co-sponsored by NATO and the Engineering Foundation, and took place in Ventura, California in August 1992. The goal of the organizers was to bring together and facilitate the exchange of information and ideas between researchers involved in the development of techniques for nanometer-scale modification and manipulation. Theorists investigating the fundamental mechanisms of the processes involved in modification, and scientists studying the properties and applications of nanostructures. About seventy scientists from all over the world participated in the conference. It has been more than 30 years since Richard Feynman wrote his prophetic article: "There is Plenty of Room at the Bottom" (Science and Engineering, 23, 22, 1960). In it he predicted that some day we should be able to store bits of information in structures composed of only 100 atoms or so, and thus be able to write all the

information accumulated in all the books in the world in a cube of material one two-hundredths of an inch high. He went on to say, "the principles of physics, as far as I can see, do not speak against the possibility of maneuvering things atom by atom." Since that time there has been significant progress towards the realization of Feynman's dreams. *Emerging Trends in Digital Era Through Educational Technology* Routledge. Probably more than any other element, iron markedly influences the chemical and physical properties of soils and sediments in the earth. Considering its transition metal status, with potential variation in electronic configuration, ionic radius, and magnetic moment, combined with its abundance and relatively large mass, little wonder that one sees its unique influence on every hand. Presentations at the NATO Advanced Study Institute (NATO ASI) on Iron in Soils and Clay Minerals reviewed and discussed the occurrence, behavior, and properties of Fe-bearing minerals found in soils and in the clay mineral groups kaolinite, smectite, and mica. Also discussed at

the NATO ASI were the basic chemical properties of Fe, methods for separating and identifying Fe in minerals, and the role of Fe minerals in weathering and other soil-forming processes. The present publication is the reviewed and edited proceedings of that Advanced Study Institute. The sequence of chapters follows the general pattern beginning with introductory chapters which overview the general occurrence of Fe in the earth and its chemistry, both generally and in mineral environments, followed by identification and characterization methods for Fe and Fe phases in minerals. The properties and behavior of Fe oxides, Fe-bearing clay minerals, and other Fe minerals in soils are then described, and the text ends with a summary of the role of Fe in soil-forming processes. A Table of Contents and subject index are provided to assist the reader in finding specific topics within the text. *Brain Mapping* Archaeopress Publishing Ltd. This book reviews the key policy debates during the post-crash era, describing the issues that policymakers grappled

with, the decisions that they took and the details of the policy instruments that were created.

Focusing specifically on issues in monetary and fiscal policy, chapters demonstrate that very little that was done during this period conformed to the simple textbook treatment of macroeconomic policy: central banks cutting policy rates or finance ministers cutting the rate of income tax. The author guides the reader through the revolution in the conduct of macroeconomic policy in an engaging and approachable manner, and illuminates the key innovations in the toolkit and themes in the debate over past years with great detail, from negative rates to quantitative easing, and from austerity versus financial repression, restructuring and default to productivity puzzles and deflation.

This book publishes the results of 220 botanical samples from the 1993-2002 Gordion excavations directed by Mary Voigt. Together with Naomi Miller's 2010 volume (*Gordion Special Studies 5*), this book

completes the publication of botanical samples from Voigt's excavations. The book aims to reconstruct agricultural decision making using archaeological and paleoenvironmental data from Gordion to describe environmental and agricultural changes at the site. John M. Marston argues that different political and economic systems implemented over time at Gordion resulted in patterns of agricultural decision making that were well adapted to the social setting of farmers in each period, but that these practices had divergent environmental impacts, with some regimes sponsoring sustainable agricultural practices and others leading to significant environmental change. The implications of this book are twofold: Gordion will now be one of the best published agricultural datasets from the entire Near East and, thus, serve as a valuable comparable dataset for regional synthesis of agricultural and environmental change, and the methods the author developed to reconstruct agricultural change at Gordion serves as tools to engage questions about the

relationship between social and environmental change at sites worldwide. Other books address similar themes but none in the Near East address these themes in diachronic perspective such as we have at Gordion. University Museum Monograph, 145

How to Write an Online Course: From concept to completion one step at a time is not intended to be an actual how-to guide to

developing an online course. Rather, it is a journal of one writing teacher's exploration of a new and better way to help aspiring authors write, publish, and promote their nonfiction books. When I started blogging about my first tentative steps down the path of writing an online course, it was not my intention to combine the posts into a book. By the time I reached Blog # 48, however, I realized that these musings might be of help to others who are starting from scratch as I was. There is a steep learning curve for the uninitiated. For adult students, who may be new to online learning, their first experience may seem confusing and overwhelming until they learn their way around this unfamiliar terrain. For educators, writing and facilitating an online course requires lots of time; knowledge of the subject matter, learning styles, presentation techniques, and e-learning technology; as well as the psychology of keeping students interested in the material and motivated enough to remain in the course. Sometimes, that is the greatest challenge.

How to Write an Online Course McGraw Hill Professional

Drawing upon perspectives from across the globe and employing an interdisciplinary life course approach, this handbook explores the production and reproduction of different types of inequality across a variety of social contexts. Inequalities are not static, easily measurable, and essentially quantifiable circumstances of life. They are processes which impact on individuals throughout the life course, interacting with each other, accumulating, attenuating, reproducing, or distorting themselves along the way. The chapters in this handbook examine various types of inequality, such as economic, gender, racial, and ethnic inequalities, and analyse how these inequalities manifest themselves within different aspects of society, including health,

education, and the family, at multiple levels and dimensions. The handbook also tackles the global COVID-19 pandemic and its striking impact on the production and intensification of inequalities. The interdisciplinary life course approach utilised in this handbook combines quantitative and qualitative methods to bridge the gap between theory and practice and offer strategies and principles for identifying and tackling issues of inequality. This book will be indispensable for students and researchers as well as activists and policy makers interested in understanding and eradicating the processes of production, reproduction, and perpetuation of inequalities.

In the mid-1980s the European Journal of Biochemistry set out to publish review articles. The enterprise proved successful, resulting in high-level reviews written by well-known scientists appearing in the Journal. The reviews represent emerging and rapidly growing fields of research in fundamental as well as

applied areas of biochemistry, such as medicine, biotechnology, agriculture and nutrition. Novel methodological and technological approaches which stimulate biochemical research are also included. The authors of the reviews are explicitly asked to be critical, selective, evaluative and

interdisciplinary oriented. The reviews should encourage young scientists to think independently and creatively, and inform active investigators about the state of the art in a given field.
