Using an analysis of learning by a case study comparison of two undergraduate courses at a United States University, Nespouk examines the way in which education and power merge in physics and management. Through this study of

politics and practices of knowledge, he explains how students, once accepted on these courses, are facilitated on a path to power; physics and management being core disciplines in modern society. Taking strands from constructivist psychology, post-modern geography, actor-network theory and feminist sociology, this book develops a theoretical language for analysing the production and use of knowledge. He puts forward the idea that learning, usually viewed as a process of individual minds and groups in face-to-face interaction, is actually a process of activities organised across space and time and how organisations of space and time are produced in social practice.; Within this context educational courses are viewed as networks of a larger

whole, and individual courses are points in the network which link a wider relationship by way of texts, tasks and social practices intersecting with them. The book shows how students enrolled on such courses automatically become part of a network of power and knowledge.

Students with diverse backgrounds will face a multitude of decisions in a variety of engineering, scientific, industrial, and financial settings. They will need to know how to identify problems that the methods of operations research (OR) can solve, how to structure the problems into standard mathematical models, and finally how to apply or develop computational tools to solve the problems. Perfect for any one-semester course in OR, *Operations Research: A Practical Introduction* answers all of these needs. In addition to providing a practical introduction and guide to using

OR techniques, it includes a timely examination of innovative methods and practical issues related to the development and use of computer implementations.
