ANIMALS||BODY SYMMETRY||COELOM||GERM LAYERS||Animal Classification And Body Symmetry At a very basic level of classification, true animals can be largely divided into three groups based on the type of symmetry of their body plan: radially symmetrical, bilaterally symmetrical, and asymmetrical. Only a few animal groups display radial symmetry, while asymmetry is a unique feature of phyla Porifera (sponges).

27.2A: Animal Characterization Based on Body Symmetry ... The following points highlight the five main types of symmetry seen in animals. The types are: 1. Asymmetrical Symmetry 2. Spherical Symmetry 3. Radial Symmetry 4. Biradial Symmetry 5. Bilateral Symmetry.

Type # 1. Asymmetrical Symmetry: In some animals there are no body axis and no plane of symmetry, hence the animals are called asymmetrical.

Asymmetry is a unique feature of Parazoa (Figure 2a).

Features Used to Classify Animals | Biology II The type of symmetry is found in some sponges (Sycon), cnidarians (e.g. Hydra jelly), and echinoderms (e.g. star fish). When the body can be divided into two similar halves by one or two vertical planes only, the radial symmetry is called biradial symmetry. It is present in the sea anemones.

Classification: Basis, Principles, Importance of ... Three types of symmetry seen in the animals are spherical symmetry, radial symmetry and bilateral symmetry. In spherical symmetry, the body of the individual can be divided into similar halves by any plane passing through the centre. The animals showing spherical symmetry have spherical shape and the sides of the body are not distinguishable.

Radial: Body parts are symmetrical around a central point. Body parts radiate out from this central point. Bilateral: The left and right sides of a body are alike and of equal proportion.

Asymmetrical: The body has no definite shape and there is no symmetry.

Such an animal has no ends or sides, and any plane passing through the centre will divide the animal into equivalent halves. Symmetry | biology | Britannica Animals with bilateral symmetry are classified into a large group called the bilateria which contains 99% of all animals (comprising over 32 phyla and 1 million described species). All bilaterians have some asymmetrical features; for example, the human heart and liver are positioned asymmetrically despite the body having external bilateral symmetry. Symmetry in biology - Wikipedia Classification of animal Kingdom is based on some fundamental features like symmetry, levels of organization, coelom, segmentation, notochord etc. Besides these each phylum or class has many distinctive and specific features.
